# Visualize the clusters (example using two numerical columns, adjust
as needed)
chart = alt.Chart(df customer churn data).mark circle().encode(
   x='rev per month',
   y='Tenure',
   color='Cluster:N',
   tooltip = ['rev_per_month', 'Tenure', 'Cluster']
).properties(
   title='Customer Segmentation'
).interactive()
# Save the plot
chart.save('customer_segmentation_plot.json')
```

Can not use Altair to visualize the chart in notebook as it has more than 5000 rows.

Now i will Try to visualize the Chart by Importing Plotly!

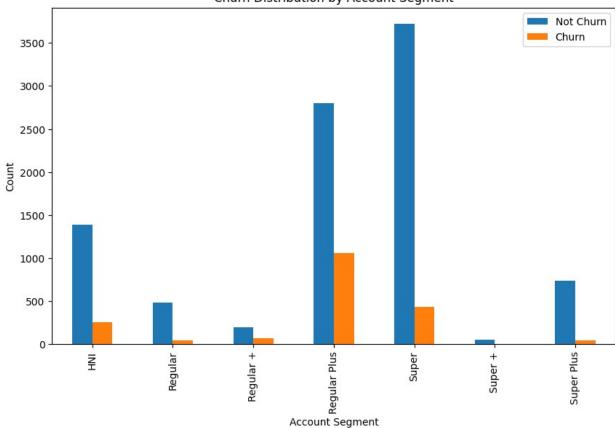

```
# Display the plot
fig.show()
```

## Customer Segmentation - rev\_per\_month vs Tenure

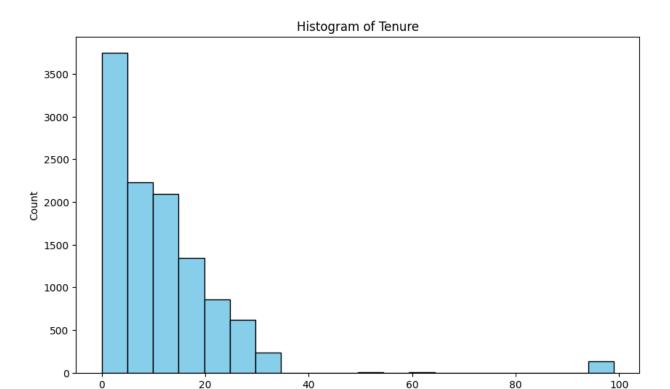

```
import matplotlib.pyplot as plt
# 1. Bar Chart: Churn Distribution by Account Segment
# Count the occurrences of each `account segment` for both churned and
non-churned customers
churn counts = df customer_churn_data.groupby(['account_segment',
'Churn']).size().reset index(name='Count')
# Pivot the data for plotting
churn pivot = churn counts.pivot(index='account segment',
columns='Churn', values='Count')
# Plot the bar chart
churn_pivot.plot(kind='bar', figsize=(10, 6))
plt.title('Churn Distribution by Account Segment')
plt.xlabel('Account Segment')
plt.ylabel('Count')
plt.legend(['Not Churn', 'Churn'])
plt.show()
```

```
# 2. Histogram: Histogram of Tenure

# Plot the histogram
plt.figure(figsize=(10, 6))
plt.hist(df_customer_churn_data['Tenure'], bins=20, color='skyblue',
edgecolor='black')
plt.title('Histogram of Tenure')
plt.xlabel('Tenure')
plt.ylabel('Count')
plt.show()
```

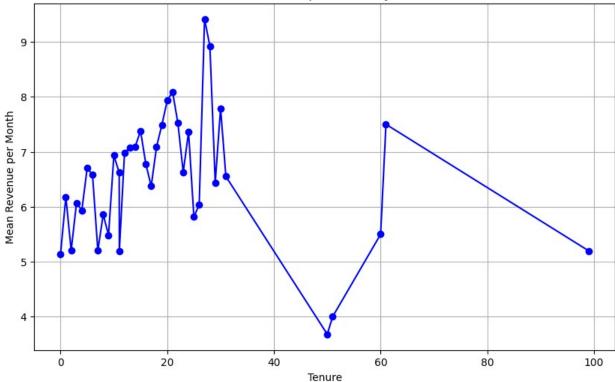

Tenure

```
# 3. Line Chart: Mean Revenue per Month by Tenure
# Group the data by `Tenure` and calculate the mean of `rev_per_month`
tenure_revenue = df_customer_churn_data.groupby('Tenure')
['rev_per_month'].mean().reset_index()

# Plot the line chart
plt.figure(figsize=(10, 6))
plt.plot(tenure_revenue['Tenure'], tenure_revenue['rev_per_month'],
marker='o', linestyle='-', color='b')
plt.title('Mean Revenue per Month by Tenure')
plt.xlabel('Tenure')
plt.ylabel('Mean Revenue per Month')
plt.grid(True)
plt.show()
```

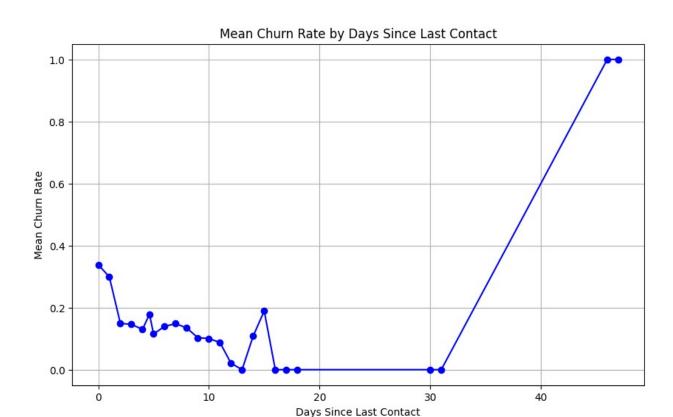

## **Customer Journey Maps**

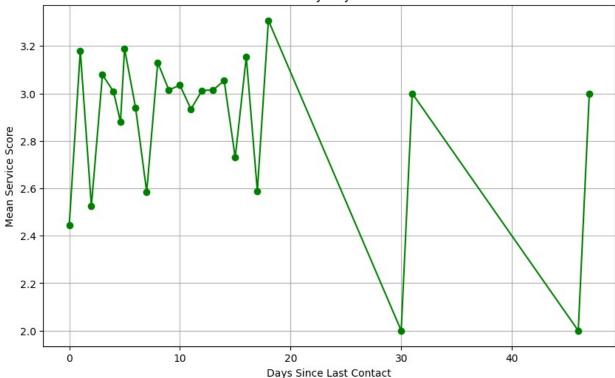

```
# 1. Group the data by `Day_Since_CC_connect` and calculate the mean
of `Churn`, `Service_Score`, and `Complain_ly`. Reset the index and
store the result in `journey_data`.
journey_data = df_customer_churn_data.groupby('Day_Since_CC_connect')
[['Churn', 'Service_Score', 'Complain_ly']].mean().reset_index()

# 2. Create a line chart using matplotlib with `Day_Since_CC_connect`
on the x-axis and the mean of `Churn` on the y-axis. Add appropriate
title and labels.
plt.figure(figsize=(10, 6))
plt.plot(journey_data['Day_Since_CC_connect'], journey_data['Churn'],
marker='o', linestyle='-', color='b')
plt.title('Mean Churn Rate by Days Since Last Contact')
plt.xlabel('Days Since Last Contact')
plt.ylabel('Mean Churn Rate')
plt.grid(True)
```

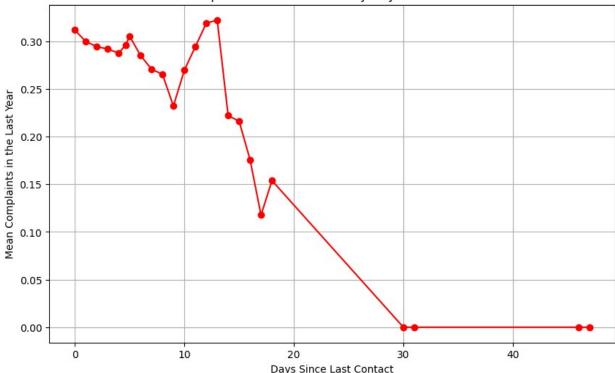

```
# 3. Create another line chart with `Day_Since_CC_connect` on the x-
axis and the mean of `Service_Score` on the y-axis. Add appropriate
title and labels.
plt.figure(figsize=(10, 6))
plt.plot(journey_data['Day_Since_CC_connect'],
journey_data['Service_Score'], marker='o', linestyle='-', color='g')
plt.title('Mean Service Score by Days Since Last Contact')
plt.xlabel('Days Since Last Contact')
plt.ylabel('Mean Service Score')
plt.grid(True)
```

```
# 4. Create a third line chart with `Day_Since_CC_connect` on the x-
axis and the mean of `Complain_ly` on the y-axis. Add appropriate
title and labels.
plt.figure(figsize=(10, 6))
plt.plot(journey_data['Day_Since_CC_connect'],
journey_data['Complain_ly'], marker='o', linestyle='-', color='r')
plt.title('Mean Complaints in the Last Year by Days Since Last
Contact')
plt.xlabel('Days Since Last Contact')
plt.ylabel('Mean Complaints in the Last Year')
plt.grid(True)
```

# We will proceed with model training using the Random Forest Classifier.

```
from sklearn.model_selection import train_test_split
from sklearn.ensemble import RandomForestClassifier
from sklearn.metrics import accuracy_score, precision_score,
recall_score, fl_score, confusion_matrix, classification_report
from sklearn.preprocessing import LabelEncoder
```

### Preparing Data for Model development!

```
# Encode categorical variables
le = LabelEncoder()
for col in

df_customer_churn_data.select_dtypes(include='object').columns:
    df_customer_churn_data[col] =
le.fit_transform(df_customer_churn_data[col])

# Split data into features (X) and target (y)
X = df_customer_churn_data.drop('Churn', axis=1)
y = df_customer_churn_data['Churn']

# Split data into training and testing sets
X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.2, random_state=42)
```

```
# Print the shapes of the resulting datasets
print("X_train shape:", X_train.shape)
print("X_test shape:", X_test.shape)
print("y_train shape:", y_train.shape)
print("y_test shape:", y_test.shape)

X_train shape: (9008, 19)
X_test shape: (2252, 19)
y_train shape: (9008,)
y_test shape: (2252,)
```

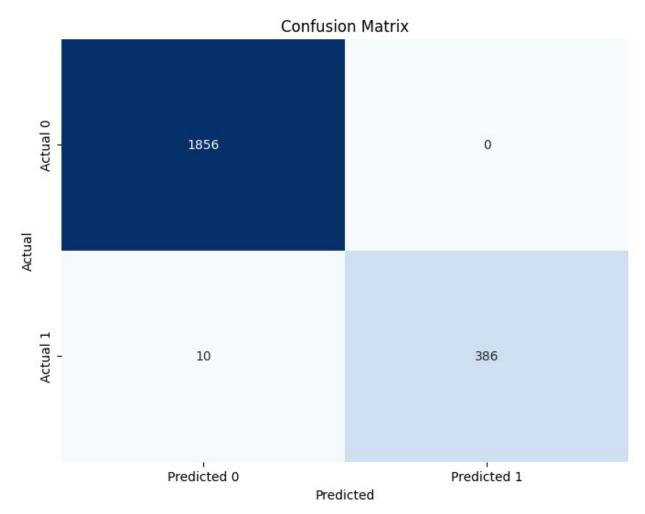

#### Initialize and train the Random Forest model!

```
# 1. Initialize the Random Forest Classifier
rf_classifier = RandomForestClassifier(random_state=42)
# 2. Train the model
rf_classifier.fit(X_train, y_train)
RandomForestClassifier(random_state=42)
# 3. Predict on the training set
y_train_pred = rf_classifier.predict(X_train)
# 4. Print the model's accuracy on the training set
print("Training Accuracy:", accuracy_score(y_train, y_train_pred))
Training Accuracy: 1.0
```

#### Make predictions on the test set

```
y pred = rf classifier.predict(X test)
#Evaluate the model
test accuracy = accuracy score(y test, y pred)
classification rep = classification report(y test, y pred)
conf matrix = confusion matrix(y test, y pred)
#Print the results
